

ABSTRACT OF THE INVENTION

A wet/dry distiller consists of an upper pot and a lower pot both of which are hollow and the upper pot is placed above the lower pot. The lower pot includes a base mounted at its bottom so as to form a receiving space. A cone is disposed around the surroundings of the inner sidewall of the upper pot so as to divide the inner space of the upper pot into an upper receiving chamber and a lower receiving chamber both of which are incommunicable. The upper receiving chamber is used to accommodate cooling water and the lower receiving chamber is communicable with the receiving space of the lower pot. An inclined annulation is disposed around the surroundings of the inner sidewall of the lower receiving chamber of the upper pot so as to form a collecting tank to collect distillate. A valve is disposed on the outer sidewall of the upper pot and is adjacent to the collecting tank.
